

Positional Value: Our Board vs. Our League's History

Rookie board weights checked against the league's own 2019–2025 record (EDSL→EFA→MLS lineage). This is **not** external validation — it's our league's empirical truth, so where the board disagrees, the board is what to question.

Position hierarchy — two methods, side by side

Pos	League history (win-lift · rank)	Our board (LEV · rank)	Verdict
RB	19.8 · #1	0.92 · #2	Aligned — top winning engine
LB	18.8 · #2	1.00 · #1	Aligned — top winning engine
TE	14.4 · #3	0.53 · #5	DIVERGE — board ranks TE too low
WR	13.0 · #4	0.62 · #4	Aligned
S	10.9 · #5	0.33 · #7	OK — high lift, but easiest to replace late
QB	10.3 · #6	0.78 · #3	WATCH — board's most aggressive call
DE	7.2 · #7	0.50 · #6	Aligned — both fade vs. market price
DT	5.7 · #8	0.30 · #8	Aligned — low
CB	-2.7 · #9	0.28 · #9	Aligned — "do not pay"

Win-lift = all-play win-rate gain from a top-quartile room (memo Table 1). LEV = our positional leverage multiplier (RANKING-METHODOLOGY §2.2).

Why it agrees: replaceability is our scarcity argument in disguise

The memo's **late-draft (R3–5) 150+ hit rate** is the same idea as our replacement-level math: hard to replace → draft early; easy → wait/churn.

Hard to replace late — draft early	Easy / churn — can wait
TE 0.0% · WR 2.2% · LB 3.1% · DT 3.3% · DE 4.7% · RB 5.5%	QB 8.3% · S 28.5% · CB 43.4%

TE is the single hardest position to replace late (0.0%) — the strongest argument that the board under-weights it.

Where the board should move

1. TE — bump it (actionable). Our own history rates TE **above** WR in winning lift and shows it's the hardest position to replace late (0.0%). The board has TE a notch *below* WR. With this league's TE-premium scoring (1.5/rec) saying the same thing, **raise LEV[TE] toward/above WR and re-rank.** (Ranking-layer change; the app consumes whatever board it's handed.)

2. QB — watch Simpson at #2. History rates QB room-lift only middling (10.3) and says “buy one anchor, don't overpay for depth.” Putting **one** QB (Simpson) at #2 is the anchor play, so it's not a contradiction — but it's the

board's most aggressive bet and the first knob to revisit.

3. S (safety) — no change needed. History rates S mid-pack, but it's also the second-easiest position to replace late (28.5%). For a **rookie** draft, fading rookie safeties is still right — source S cheap and late.

Bottom line: our board matches our league's own history almost everywhere — RB/LB are the engines, CB is “do not pay,” DE is a market overpay, DT/S/CB are churn. The one real fix is **TE, which both the history and our scoring say should rank higher.**
